

CypherRoll: Platform Blueprint & Technical Manual

A complete technical specification of the 3-tier hybrid Web3 casino architecture, cryptographic provably fair RNG, all 6 resolved loopholes, step-by-step user operational guide, and scaling roadmap.

Repository: github.com/Pratyush-kya/cypherroll-web3	Commit: 899fb1c (Production)	Solvency Cap: \$25,000 / payout
Supabase DB: pvrnvcgmjuhfbdvudcfs	Local Web: http://127.0.0.1:3000	Tor Onion: vv4ckspjgedi...ckqd.onion

1. The 3-Tier Hybrid Architecture

Building a high-frequency Web3 casino directly on public blockchains is hindered by latency (400ms to 12s), gas fees on micro-bets, and MEV front-running. CypherRoll implements a **3-tier hybrid model** separating instant off-chain execution from non-custodial on-chain settlement:

Tier	Layer & Technologies	Responsibilities & Invariants
Tier 1 Presentation	Next.js 14 App Router, Three.js, React Three Fiber, Tailwind CSS, RainbowKit, Solana Wallet Adapter	Renders interactive 3D Blender models (dice, rocket, chip). Manages sub-50ms SSE streams and Supabase WebSockets with zero client polling.
Tier 2 Engine State	Next.js Server API, Node.js CSPRNG, EIP-712 Signer, SSE State Machine	Deterministic HMAC-SHA256 commit-reveal RNG. Atomic escrow wager locks. EIP-712 typed signature generation under \$25k Kelly ceiling.
Tier 3 Ledger & Vaults	Supabase PostgreSQL (ACID), Base/Arbitrum Smart Contracts, Tor v3 daemon	Durable audit ledger. Non-custodial EVM escrow vaults. Continuous solvency assertion: $\Sigma \text{Player Balances} \leq \text{Total Vault Reserves}$.

2. The 6 Critical Problems Solved & Code Changes

Each milestone directly eliminated a critical financial, cryptographic, or network vulnerability:

Milestone	Vulnerability & Risk	Engineered Solution & Code
Step 1: Multi-Chain Auth	Unverified Wallets: Frontend address spoofing allowed claiming arbitrary balances.	SIWE / SIWS Nonces: Server verifies EIP-4361 secp256k1 (EVM) and Ed25519 (Solana) cryptographic signatures. Issues signed HTTP-only HMAC session cookie. <i>Files: lib/web3/useAuth.ts, app/api/auth/verify/route.ts</i>
Step 2: Crash Engine	Double-Spend Race: Parallel bet requests spent same balance simultaneously before deduction.	Atomic Escrow Lock: Single continuous state loop (50ms SSE). Atomic balance deduction (<code>.gte('balance_usdc', wager)</code>) during 5s countdown window. <i>Files: lib/crash-engine.ts, app/api/games/crash/stream/route.ts</i>
Step 3: Supabase Realtime	HTTP Polling Collapse: 3-second fetch loops saturated backend connections.	WebSocket Subscriptions: Event-driven <code>global_trollbox</code> channel. Added <code>presence.track()</code> for live online degen count and live bets ticker. <i>Files: components/rollbit/Trollbox.tsx, LiveBetsTicker.tsx</i>
Step 4: EIP-712 Signer	Whale Depletion & Replays: Uncapped payouts or replayed signatures draining treasury.	Structured Vouchers & Kelly Cap: EIP-712 typed data hashing with monotonic nonces. Enforces hard safety cap of \$25,000 per automated withdrawal. <i>Files: contracts/evm/CypherRollVault.sol, lib/web3/withdrawal-signer.ts</i>

Step 5: Deposit & Solvency	Fake Deposits & Insolvency: Replay of deposit tx hash; liabilities exceeding assets.	RPC Listener & Solvency Invariant: Confirmed receipt checks, idempotent tx recording, and live solvency assertion: $\Sigma \text{Balances} \leq \text{Vault Reserves}$. Files: lib/web3/deposit-listener.ts, BankrollVault.tsx
Step 6: Tor & ChunkLoad Fix	ChunkLoadError & Tor DNS: Next.js standalone cache collisions; Tor blocking localhost lookups.	Bundler Gating & Native Onion: Gated standalone builds, scoped QueryClient, disabled autoConnect, and launched native Tor v3 hidden service. Files: next.config.mjs, Web3Providers.tsx, docker/nginx/

3. How to Use & Test the Application

- A. Accessing the Platform:
- **Normal Browser (Chrome/Firefox):** Navigate to http://localhost:3000 or http://127.0.0.1:3000.
 - **Tor Browser:** Enter http://127.0.0.1:3000/ (using 127.0.0.1 bypasses remote DNS) or open native hidden service: http://vv4ckspjgediwc35ymcdusikc32msma5rc3t4m7n7aml7ddkaex5ckqd.onion.

1. Authentication	Click 'Connect Wallet' → Select RainbowKit (Base/Arbitrum) or Solana (Phantom). Sign challenge nonce to receive 1,000.00 USDC testnet balance.
2. 3D Dice	Adjust Roll Target slider (e.g. Under 50.00). Click 'Roll Dice' → outcome resolves instantly via HMAC-SHA256; 3D beveled dice rolls in Three.js canvas.
3. Multiplayer Crash	Place bet during 5.0s countdown. Funds lock in escrow. As 3D rocket ascends, multiplier climbs via 50ms SSE stream. Click 'Cash Out' before crash point.
4. Trollbox & Chat	Live presence tracker displays actively connected players. Messages stream instantly via Supabase WebSockets with zero page refresh.
5. Cashier & Solvency	Deposit via testnet RPC confirmation. Withdrawals generate an on-chain EIP-712 voucher. Stake in Bankroll Vault to earn 19.4% APY as community LP.

4. Provably Fair Cryptographic Verification

Mathematical Commitment: The operator commits to $\text{ServerSeedHash} = \text{SHA256}(\text{ServerSeed})$ before betting. Outcome is derived deterministically without operator intervention:

$\text{HMAC} = \text{HMAC_SHA256}(\text{ServerSeed}, \text{ClientSeed} + ':' + \text{Nonce})$

$\text{Roll} = (\text{parseInt}(\text{HMAC}[0..8], 16) / 2^{32}) * 100$

- Dice House Edge: 1.0% → Multiplier = 99.00 / WinChance
- Crash House Edge: 2.0% → 10,000 game simulation verified mean dice 49.88 and 2.75% instant crash.

5. Future Scaling & Hardening Roadmap

Frontier	Implementation Description
Redis Cluster Pub/Sub	Decouple Crash engine from single Node.js process into Redis 7 Pub/Sub cluster with Lua scripts for horizontal multi-region scaling.
Decentralized VRF	Integrate Chainlink VRF (EVM) or Pyth Entropy (Solana) for zero-trust seed generation on high-roller tables (\$100k+).
Automated AML Screening	Attach Chainalysis / Elliptic webhooks to deposit listener to automatically flag and quarantine sanctioned addresses.
WASM Proof-of-Work	Require client-side minimal PoW (SHA-256 challenge in WASM) before Trollbox or bet submissions to defeat Tor bot floods without CAPTCHAs.
